

json2puml

Make data visible and understandable

Jens Fudickar, April 2022

API's and DATA

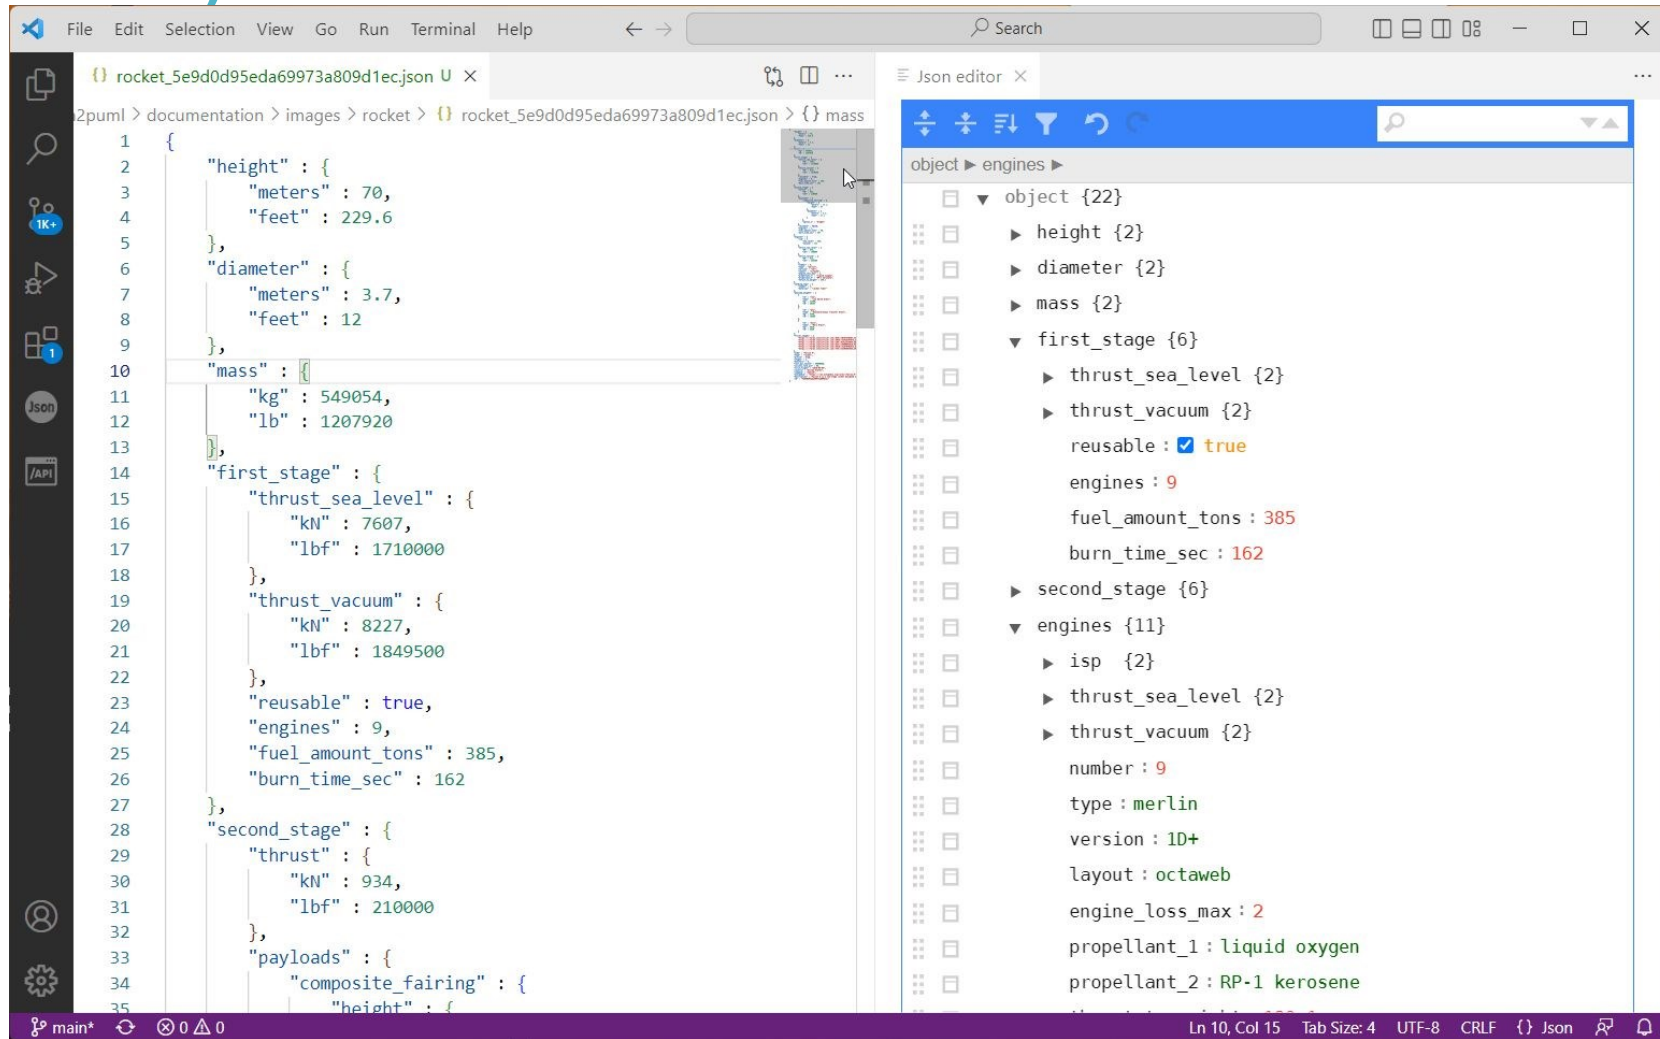

Working with API's leads to working with JSON data

A typical answer of a REST API call can look like this:

```
{
  "height": {
    "meters": 70,
    "feet": 229.6
  },
  "diameter": {
    "meters": 3.7,
    "feet": 12
  },
  "mass": {
    "kg": 549054,
    "lb": 1207920
  },
  "first_stage": {
    "thrust_sea_level": {
      "kN": 7607,
      "lbf": 1710000
    },
    "thrust_vacuum": {
      "kN": 8227,
      "lbf": 1849500
    },
    "reusable": true,
    "engines": 9,
    "fuel_amount_tons": 385,
    "burn_time_sec": 162
  },
  "second_stage": {
    "thrust": {
      "kN": 934,
      "lbf": 210000
    },
    "payloads": {
      "composite_fairing": {
        "height": {
          "meters": 13.1,
          "feet": 43
        },
        "diameter": {
          "meters": 5.2,
          "feet": 17.1
        }
      },
      "option_1": "dragon",
      "reusable": false,
      "engines": 1,
      "fuel_amount_tons": 90,
      "burn_time_sec": 397,
      "engines": {
        "isp": {
          "sea_level": 288,
          "vacuum": 312
        },
        "thrust_sea_level": {
          "kN": 845,
          "lbf": 190000
        },
        "thrust_vacuum": {
          "kN": 914,
          "lbf": 205500
        },
        "number": 9,
        "type": "merlin",
        "version": "1D+",
        "layout": "octaweb",
        "engine_loss_max": 2,
        "propellant_1": "liquid oxygen",
        "propellant_2": "RP-1 kerosene",
        "thrust_to_weight": 180.1
      },
        "landing_legs": {
          "number": 4,
          "material": "carbon fiber"
        },
        "payload_weights": [
          {
            "id": "leo",
            "name": "Low Earth Orbit",
            "kg": 22800,
            "lb": 50265
          },
          {
            "id": "gto",
            "name": "Geosynchronous Transfer Orbit",
            "kg": 8300,
            "lb": 18300
          },
          {
            "id": "mars",
            "name": "Mars Orbit",
            "kg": 4020,
            "lb": 8860
          }
        ],
        "flickr_images": [

        ],
        "name": "Falcon 9",
        "type": "rocket",
        "active": true,
        "stages": 2,
        "boosters": 0,
        "cost_per_launch": 50000000,
        "success_rate_pct": 98,
        "first_flight": "2010-06-04",
        "country": "United States",
        "company": "SpaceX",
        "wikipedia": "https://en.wikipedia.org/wiki/Falcon_9",
        "description": "Falcon 9 is a two-stage rocket designed and manufactured by SpaceX for the reliable and safe transport of satellites and the Dragon spacecraft into orbit.",
        "id": "5e9d0d95eda69973a809d1ec"
      }
    }
  }
}
```

How to visualize / understand this ?

(Online) JSON Editor

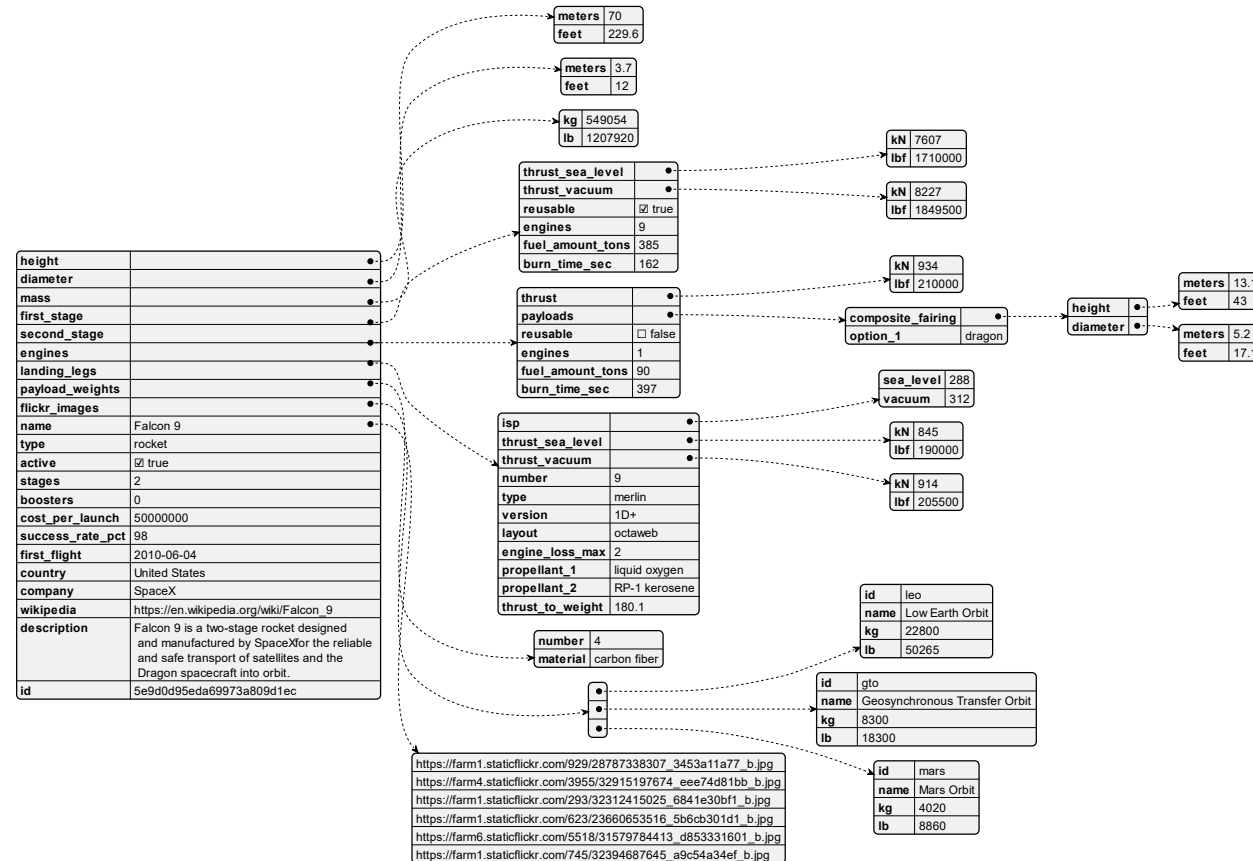

This makes the live easier but it is still complex 😊

Confluence and Standard PlantUML

PlantUML supports an OOTB visualisation of JSON.

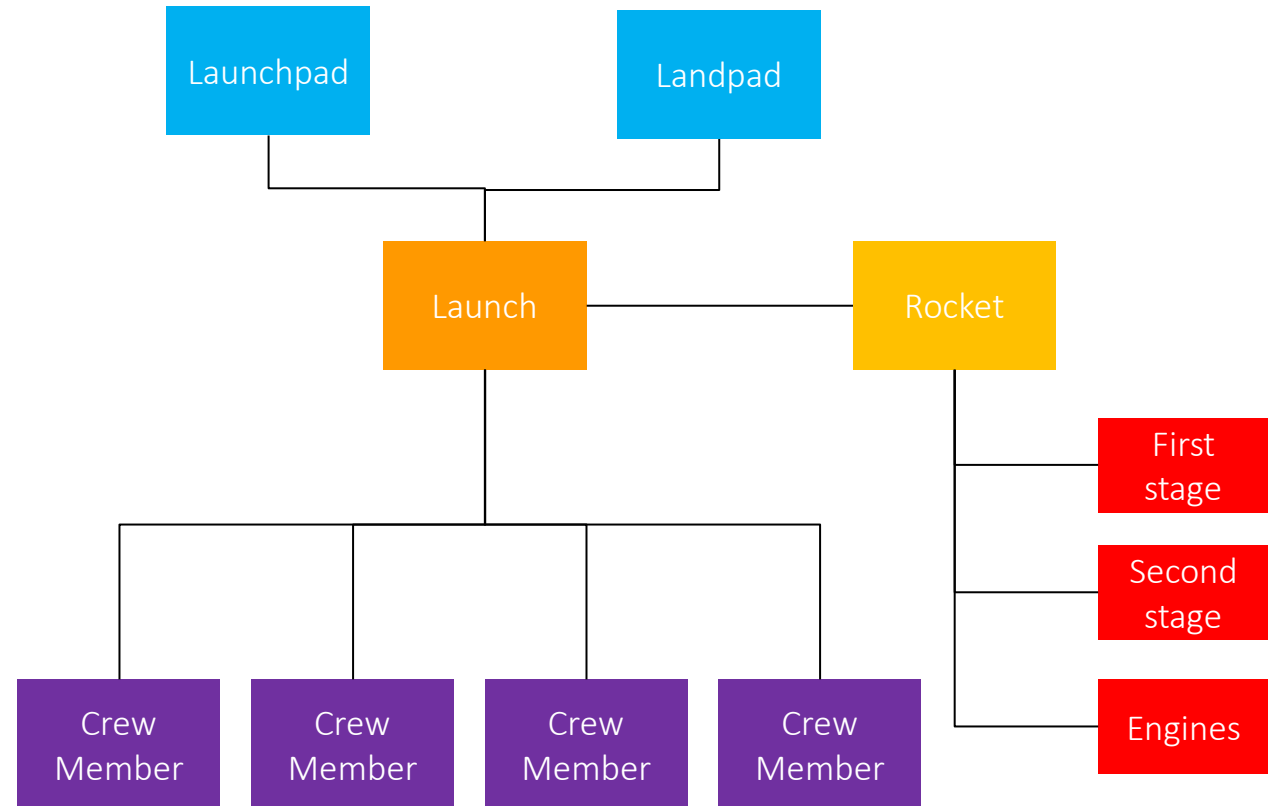

```
@startjson
<json>
@endjson
```

This improves also, but there is no knowledge about the data models behind

Drawing by Hand

It's nice, and it's giving you a task.
But it's not effective, not accurate
and not fast enough.

One Solution: json2puml

Json2puml is a command line tool developed to generate PlantUML files based JSON files.

Json2puml has an understanding of how data is structured and simplifies and visualises the outcome.

json2puml has the possibility to combine the JSON results of multiple API calls into one result set.

json2puml is highly configurable to generate outcomes in different detailed levels.

json2puml is free to use for everyone.

SpaceX REST API

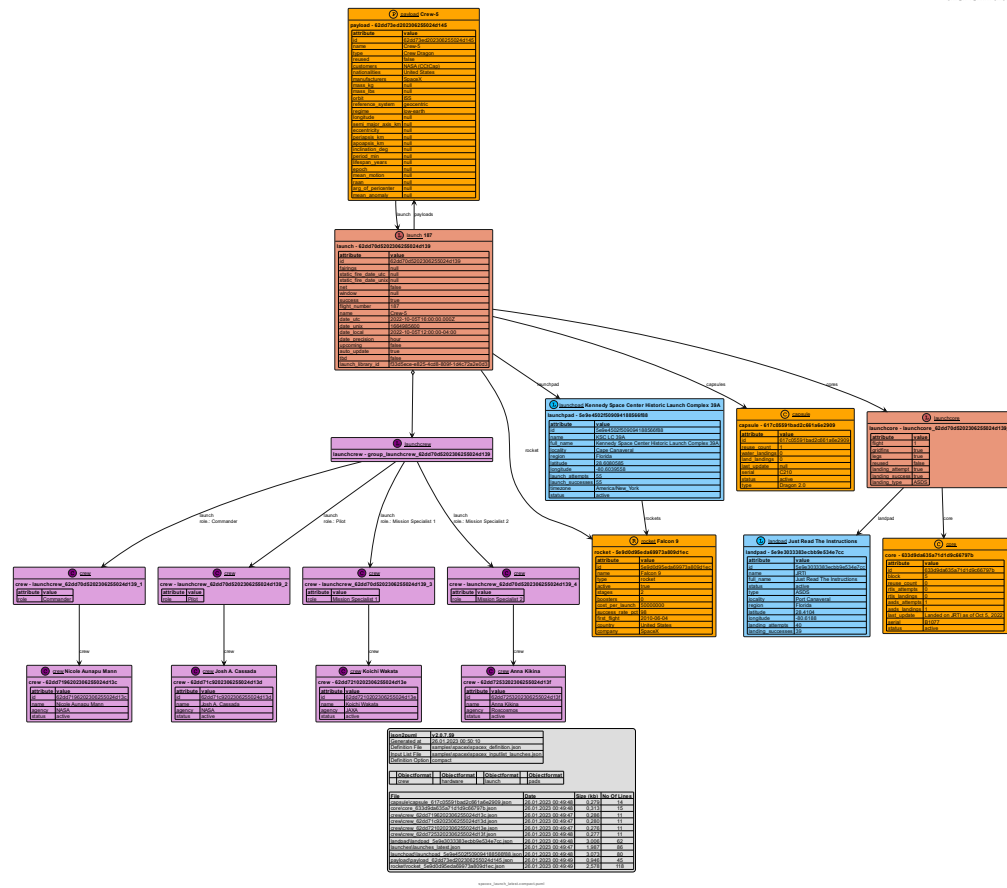

Open Source REST API for launch, rocket, core, capsule, starlink, launchpad, and landing pad data.

<https://github.com/r-spacex/SpaceX-API>

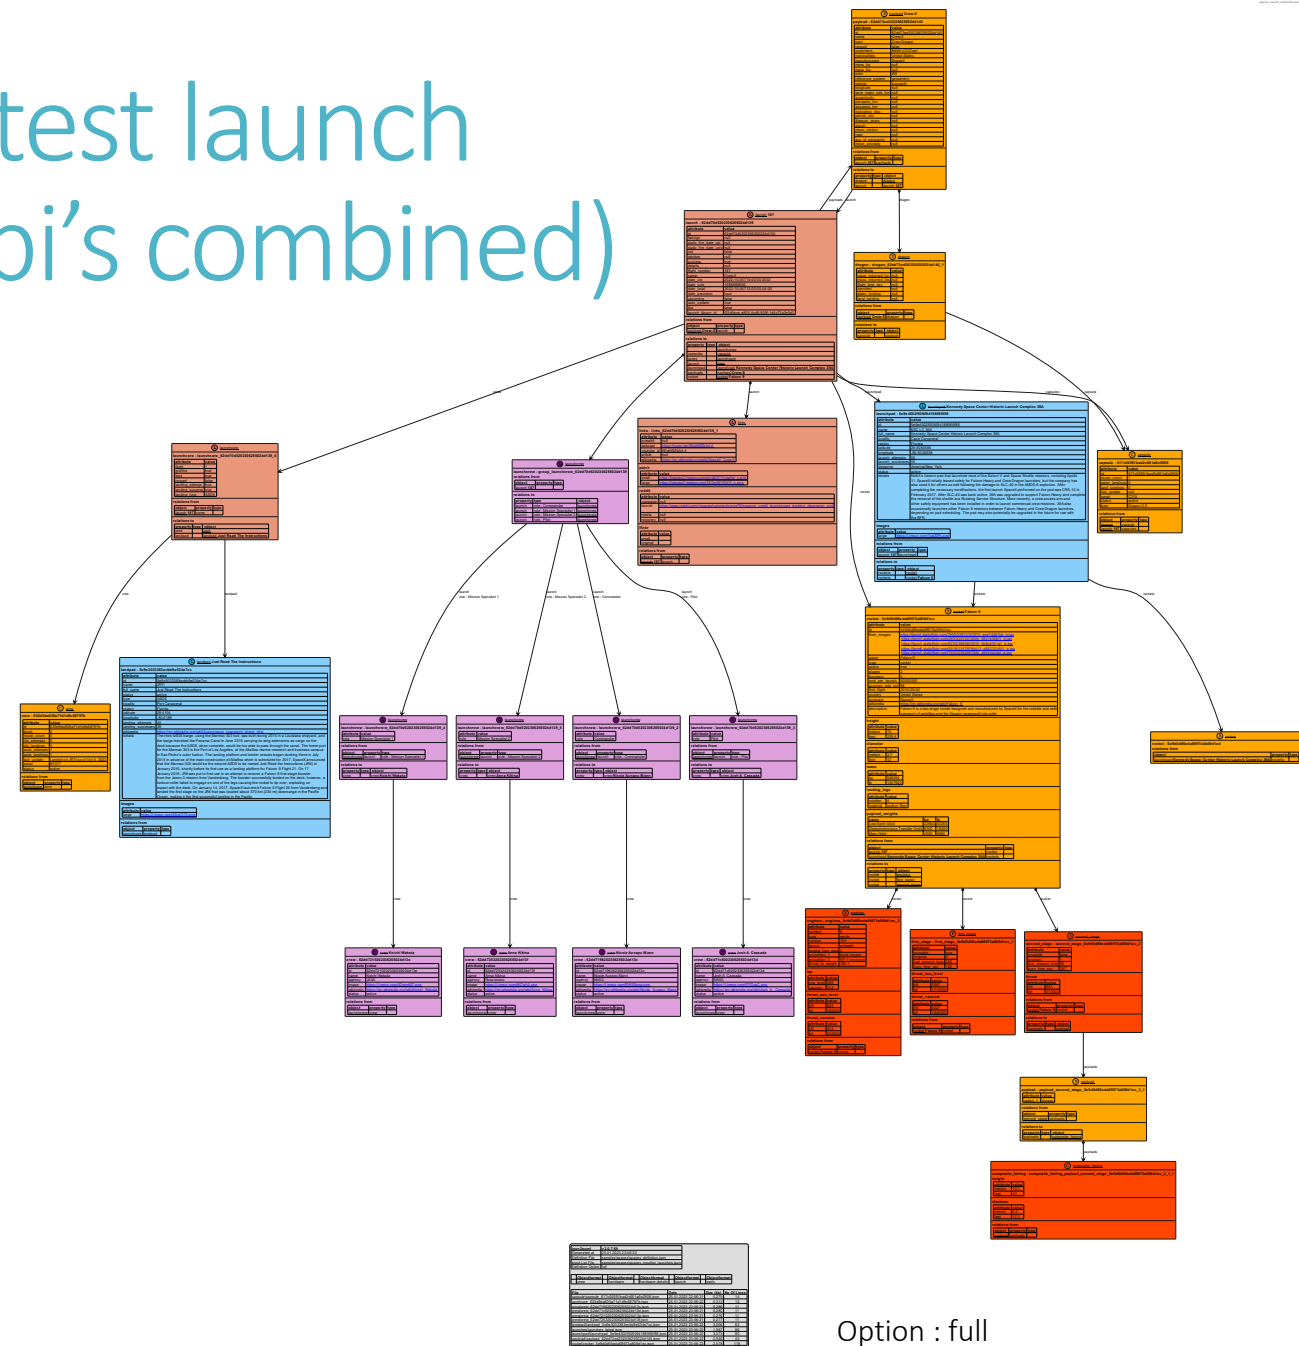

What is this?

It's an unofficial public API to receive various information about all Space X rocket launches.

All data regarding the latest launch of a Space X rocket (8 Api's combined)

Option : compact

Option : full

SWAPI - The Star Wars API

<https://swapi.dev/>

What is this?

The Star Wars API, or "swapi" (Swah-pee) is the world's first quantified and programmatically-accessible data source for all the data from the Star Wars canon universe!

We've taken all the rich contextual stuff from the universe and formatted into something easier to consume with software. Then we went and stuck an API on the front so you can access it all!

All Data

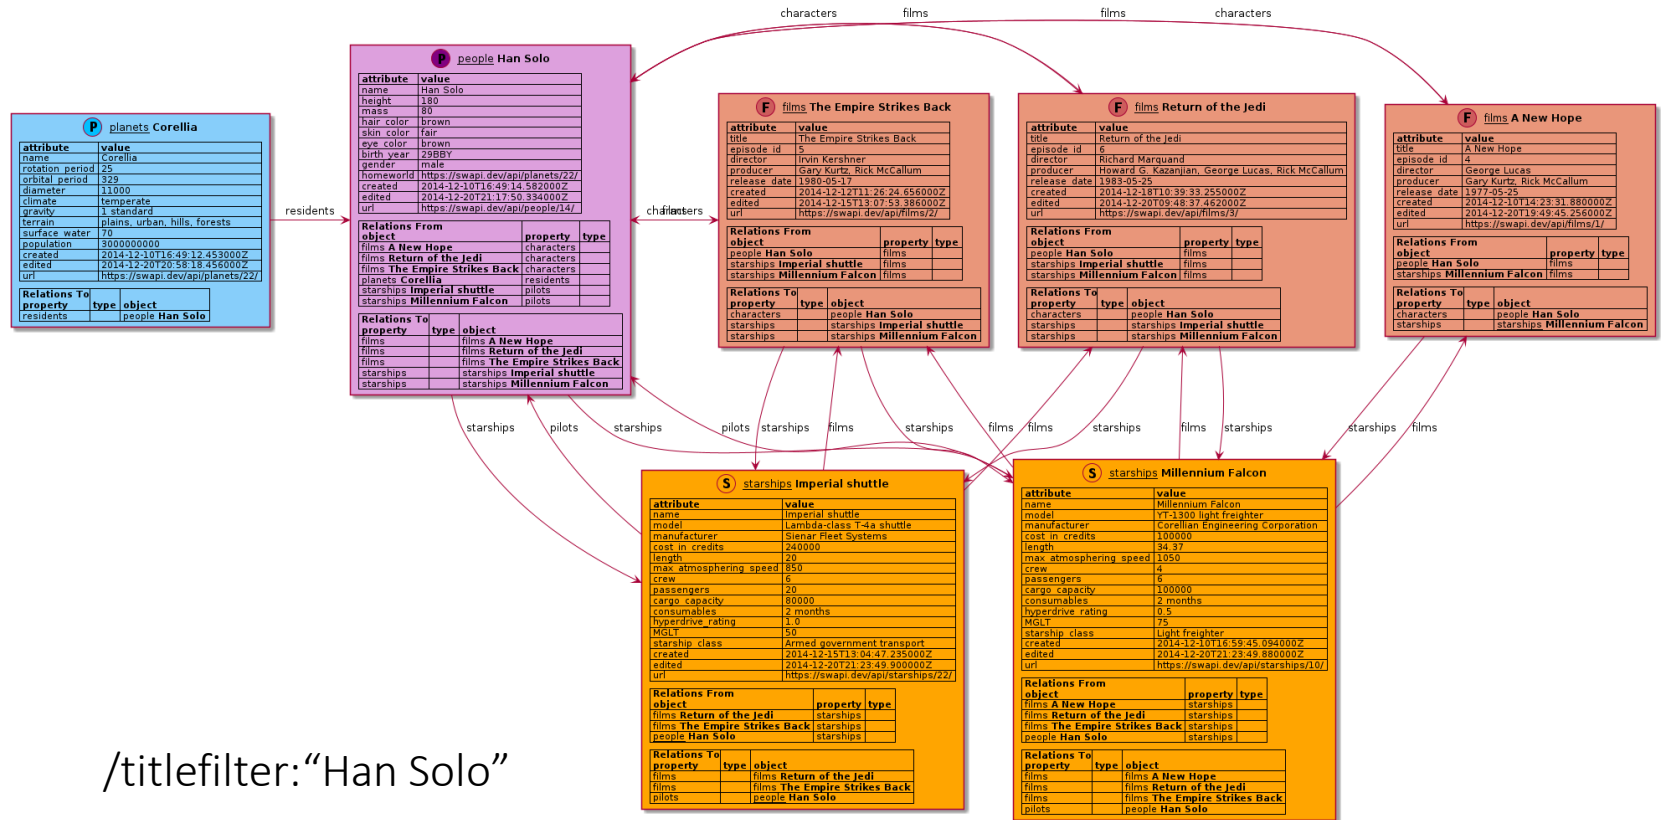

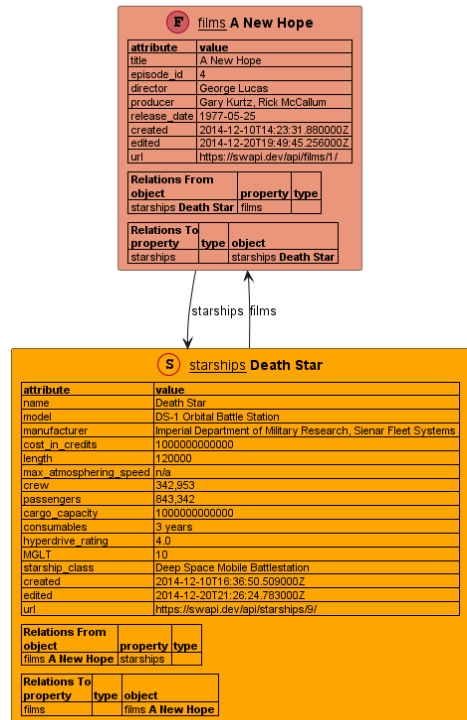

6 Films, 82 Persons, 60 Planets, 37 Species, 36 Star ships, 39 Vehicles

Examples

output:summary/full/summary.full.deathstar.puml

output:summary/full/summary.full.hansolo.puml

/titlefilter:“Han Solo”

json2puml	v1.1.10.20
Generated at	14.04.2022 11:21:55
Definition File	swapidefinition.json
Input File	output:summary/full/summary.full.deathstar.json
Definition Option	full
Title Filter	Death Star

File	Date	Size (kb)	No Of Lines
swapi-films.json	20.03.2022 17:08:22	21.087	506
swapi-people.json	20.03.2022 17:08:37	66.059	1900

output:summary/full/summary.full.hansolo.puml

How is it working

json2puml

Has three main components which can be combined

1. Fetch data from a defined set of API's using curl. (Optional)
2. Convert the JSON data into a PlantUml script.
3. Convert the PlantUml script into a SVG or PNG file using PlantUml command line utility.

json2puml

can automate the fetching of data by using data from an API result as an input criteria for the next API call.

E.g. Using the SpaceX API the `get /launch` result includes the ID of the used rocket. This ID can be used for the next `get /rocket` call.

Operating Systems

json2puml can be used on MS Windows and on Linux.
For Linux there are plain executables and docker container available.

json2puml can run as command line tool or as a service application answering on http based REST calls.

Where can you find it:

It's published on Github.com under a GPLv3 license.

<https://github.com/jfudickar/json2puml>
